Summary

One of the things I like most about my profession is the ability to keep learning. When I face new situations, I set a goal in mind, so that I can keep going no matter what happens without losing myself in the process.
These are some of my features that I developed.

- Great teamwork skills.
 - Attentive to the quality of work at every stage of the development lifecycle from design, coding, debugging, testing, and maintenance.
 - Skills and knowledge of programming tools and development practices.
- I am a very passionate and motivated person who likes to improve myself day by day.

C# TypeScript JavaScript SQL HTML/CSS ASP.NET Core React.js

MongoDB MySQL Git Terraform Jest Web App Testing Claude

Tools: Visual Studio, VS Code, SQL Server Management Studio, Azure DevOps, Docker, Postman, Playwright, Claude Code

Frameworks: .NET Framework 4.8, modern .NET (ASP.NET Core), NHibernate, Autofac, React 18, TypeScript, Nx monorepo, TanStack Query, Jotai, OData, MassTransit/RabbitMQ, Redis, MongoDB, SQL Server, OpenAI API, MCP

Third-party:

Version Control: Git (Azure DevOps Repos)

Project Management: Azure DevOps Boards (Scrum, bi-weekly release trains)

Project: Multi-tenant construction ERP SaaS platform (accounts payable, payroll, HR, time

Gulp

tracking) that syncs data bidirectionally with on-premise and cloud accounting systems (Sage 100 Contractor, Sage 300 CRE, QuickBooks Online, Acumatica, and a payroll provider). Database-per-tenant architecture, .NET monolith + modern containerized microservices on Azure, React/TypeScript frontend.

Description:

- Member of the **AI Integration team** building the platform's AI assistant: developed **MCP (Model Context Protocol) tools** — typed, deterministic, unit-tested endpoints over the payroll/HR domain — and wired them into an LLM-powered chat engine (OpenAI API, streaming-first SSE architecture with tool-lifecycle events).
- Contributed to a **Custom Reporting & BI initiative** : evaluated multi-tenant data isolation with **PostgreSQL row-level security** for a new reporting microservice.
- Diagnosed and fixed **SQL performance failures at customer scale** : resolved a family of crashes caused by SQL Server's 2,100-parameter limit by introducing a shared query-batching helper; investigated pagination timeouts and an out-of-memory failure in bulk PDF document merging.
- Root-caused **data-integrity bugs in ERP/payroll synchronization** (unique-constraint violations taking down whole batch syncs, external-ID association regressions) — separating data fixes from code fixes and proposing batch-resilience improvements.
- Fixed **financial calculation bugs** (Canadian GST/PST tax distribution, holdback/ retainage formulas), validating against real tenant data with **Playwright** browser automation before QA handoff.
- Owned **bugs end to end** : triage from customer support tickets → local reproduction → root-cause analysis (SQL/log level) → fix → PR (human + automated AI code review) → deployment via Azure Pipelines → QA coordination.
- Wrote **investigation docs and diagnostic SQL scripts** into the repo so root-cause knowledge survived beyond each ticket; worked directly with product managers and support on ambiguous behavior.
- Full-stack work in an **Nx React/TypeScript monorepo** (data grids, filtered navigation, list/detail flows) and in legacy → modern migration code paths.

GitLab

Tools: Visual Studio, Visual Studio Code, MongoDBCompass, GitLab.

Frameworks: .Net 6.0, Material UI, Redux Toolkit.

Version Control: GitLab.

Project Management: GitLab board

Project:

Project to create, update and manage events.

Web application to have better organized the events to which we register.

Web App to create simple events or events with various activities.

Control and manage users registered in the event, being able to create or delete events in their Microsoft calendars.

Description:

- Use MS service to deploy calendars this is because there is a desired feature to automatically send invitations in MS Calendar when you register for an event.
- Send a copy email notification for invites or register attendees to the organizer of the event
- Use the Formik library to detect data changes for specific events to send notifications to participants.
- Use Redux Toolkit package to manage the state of the event.
- Jest for unit tests.
- Validate max number of attendees
- Create new Endpoint to be able to register several users at the same time

SQL

Git

Tools: Visual Studio 2012, Visual Studio 2017, Visual Studio 2022, SQL Server Management Studio, Azure DevOps,

Frameworks: .Net 4.8,

Third-party: Teams

Version Control: Visual Source Safe, Git

Project Management: Azure DevOps

Project:

- Project to administer federal and state nutrition programs
- Program that handles National School Lunch and Breakfast, Food Distribution, Special Milk, Child and Adult Care Food, Summer Food Service, and Seamless Summer Feeding Option Programs

Description:

- Classic Client-Server Application using MVP to be able to:
 - Create and modify sponsor profiles
 - Create, modify and validate forms
 - Create, modify reports.
- Creation and update Stores procedures for:
 - Obtaining data
 - Updating data
 - Deleting data
 - Error control
- New tables were created and updated in the databases

Project:

- Project to create, update and manage events.
- Web application to have better organized the events to which we register.
- Web App to create simple events or events with various activities.
- Actio web application helps you enhance in-person or virtual event so your attendees can focus on what's important: learning and knowledge sharing

Description:

- Use the Formik library to detect changes in data for specific events so you can monitor event organizers and co-organizers.
- Work on the test automation part updating the expected scenarios.

- Use the Redux Toolkit package to manage the status of the event so I can make the necessary changes to update the automation tests.

Project: Spruce™ is a revolutionary solution developed using the most current technology providing a package that's easy to learn and sensibly organized. Running in a network environment, Spruce is both convenient and adaptable. Data is maintained within a secure closed SQL (structured query language) database.

Description:

- Validation of permissions when creating new users
- Modification of some reports
- Fix unexpected program malfunctions
- Correct calculations that were not carried out again when rows were deleted or product quantities changed to 0
- Work on validating coupons and sending the necessary information to the API
- Modification and creation of database tables
- Modification and creation of store procedures
- Identify permissions that are obtained from the database and structure management of such permissions
- Add new functions to the program but only see it in production and not in development
- I carried out a project in which I added a new utility to load several records at the same time and show them in a new report
- Clean Code (deleting unused code, restructuring the code in a more standardized way)

2022 Jala Foundation

React.js ASP.NET Core C# JavaScript SQL MongoDB MySQL Git
 GitLab Web App Testing Smoke/Adhoc Testing

Tools: Visual Studio, Visual Studio Code, SQL Server, Virtual Box, Azure DevOps, GitLab, Heroku, YourDay.

Frameworks: Entity Framework, Net Core, Semantic UI, Material UI.

Version Control: Git, GitLab.

Project Management : Azure DevOps, YourDay.

Project:

- Console project for a security app with different types of encryption,
- Web app to store passwords, accounts, notes securely,
- Web App to create a new resume.
- Applicants Tracker, an app for applicants in the Software Industry

Description:

- Backend development with C#, LINQ and Entity Framework for connection with the database in SQL Server, design patterns, POO, SOLID principles.
- Frontend with frameworks like ReactJs, as well as Semantic UI, Material UI, and JavaScript.
- Jest and Xunit for unit tests.

 2019 Chiflita

HTML/CSS JavaScript

Tools: Visual Studio(2015 & 2017), Google Chrome Developer

Version Control: Git

Project:

Purchase and sale management software. It offered the ability to manage customers, deliveries, and accounting, as well as integrate with services such as ordering and delivery management.

Description:

Frontend development with web forms along with HTML, JavaScript, jQuery and CSS to build dynamic forms.
 Creation of popups and special controls.

Education

2015
2021

- **Network and Telecommunications Engineering**

Universidad Privada Domingo Savio, Cochabamba, Bolivia

Degree in Network and Telecommunications Engineering. I learned network compositions, creation of servers, fiber optics, etc

Due to my performance I was able to apply for a scholarship at the CBA (**Centro Boliviano Americano of Cochabamba**).

In the middle of my career I learned front-development which caught my attention to want to specialize in that field

2020
2020

- **Diplomado - Educacion superior basado en competencias**

Universidad Mayor de San Simon

- Learning and teaching strategies
- Educational planning by competencies
- Technologies Applied to Education
- Learning Assessments
